#### **EXPERIMENT NO: 3 (a)**

**AIM:** Simulate Multiprogramming with a fixed number of tasks (MFT)

**DESCRIPTION:** Main task of this program is to allocate the incoming processes to the suitable holes into the physical memory, Where physical memory(RAM) is splitted into fixed number of partitions, each one with variable size. The incoming number of processes or tasks are fixed by default.

**LIBRARIES USED:** Language: python 3, Systems having python version >= 3 will produce output as expected. No additional libraries have been used.

#### PROGRAM-1:

```
def firstfit(partitions, processes):
    result = [-1]*len(partitions)
    internalfrag = [-1]*len(partitions)

for i in range(0, len(processes)):
    for j in range(0, len(partitions)):
        if processes[i] <= partitions[j] and result[j] == -1:
            result[j] = i+1
            internalfrag[j] = partitions[j] - processes[i]
            break

fitname = "First fit"
    output(partitions, processes, result, internalfrag, fitname)</pre>
```
